February 2, 2016 4 min read The Opinions Expressed by Entrepreneur Contributors are their own. Discipline can be difficult when you work from home. You may be too easily distracted during working hours, or you may find yourself trying to maintain a healthy work-life balance and seeing your sleep suffers as a result. Every entrepreneur faces these challenges the first time they start. There are several ways to deal with the resulting stress, but wouldn't it be better to avoid it in the first place? The solution is to develop the perfect home office environment. Here are my five tips to help you out there:1. Save the bedroom logic. If you start your business from your college dorm room or studio apartment, maintaining the logic of your bedroom can be difficult, but it should still be one of your top priorities. About half of all employees read and respond to emails in bed, a figure that rises to about 80 percent among young professionals in New York City. According to Professor Charles Seisler of Harvard Medical School, this is a serious problem. Smartphones and tablets have created a world where everything is always connected, but it's important to have a space where you can turn it off and that space should be your bedroom. If your living conditions do not allow you to keep your office in a separate room, divide your studio to create areas for work and recreation. Otherwise, your sleep health will deteriorate. Choose the right furniture. You will sit in a desk chair for a long time, so find the one that best suits your needs. Why not treat yourself? Choose one with multiple customization options - from the back to the arm support - and pay a little more if necessary. Don't skimp on table space either. This may not seem likely at first, but your desktop real estate is quick to fill up. In a recent OfficeMax poll, 77 percent of respondents said their cluttered workspace had damaged their productivity. You don't want to buy a desk just for your laptop and desk lamp only to discover that you will need a triple monitor setup. Plan an expansion startup in your furniture, and think big in advance. Related: 4 Trends in Home-Office Design3. Hold. Some people prefer to work in caves, while others crave windows. Whatever your preferences, proper light is essential to your performance. The balance between natural light and artificial light. Try different rooms in your home and different table placements in each room. Finding the right light environment will not only help your daily performance; it will also ensure that you get a good night's rest like that. Researchers from Northwestern University found that people who worked in offices with windows received 173 percent more white light than their peers windowless offices slept an average of 46 extra minutes each night and enjoyed a better quality of life4. Keep your space organized. The more you acquate your office, so you can accrete your mind. If you have space to work, go upright. Buy high shelves and start laying, and banishing inconsequential accessories to your office. Just like keeping your kitchen up par, make sure your office is modern, too. This includes a printer. If you use it on a daily basis, it should not be on your desk. I keep mine in the closet with my surplus supplies, but if you live in a shared apartment, consider investing in a utility wireless printer to save on costs. Going wireless also cuts out one of my main bugbears: cables. I can't stand poor cable control. Ditch as many cables as you can by adopting Bluetooth-enabled devices, and keep the main ones wrapped and routed to their respective location. Related: 5 ways to organize your office - Stylishly5. I don't hate distractions. Everyone has different work habits. Some people hate distractions while others crave them. I know graphic designers are Netflix at all times, but I struggle to focus with the TV in my field of view. I do, however, need a bit of background noise. Too much and my attention goes to the noise; too little, and I concentrate on how quiet it is. Find the right level of distraction to improve performance. Motivation is fleeting, but discipline is the lifeblood of any entrepreneur. If you keep your focus and create the right environment, you will set up for success. View on True KeyTrue Key Password Manager specsPlatforms: Windows, Mac (as via browser extension), Android, iOS Free version of limitation: One device; 15 passwords max 2FA: Yes browser plugins: Chrome, Edge, Firefox Form fill: No mobile PIN unlock: No biometric login: Face ID, Touch ID on iOS, Windows Hello, most Android fingerprint scannersTrue Key is part of the McAfee product suite, and this is offered as a selling point for potential McAfee antivirus customers, and is also a standalone service. It went through an impressive update around 2015, and then True Key topped the pack of top password managers with its clean, easy-to-use design and multifactorial and biometric authentication. Unfortunately, as you'll see in our review of True Key password managers, little has changed since then. True Key seems to have largely given up on McAfee, which is a disgrace because the few features it has mostly work well. At the same time, other password managers have outperformed True Key in terms of password management and multi-factor authentication. True Key has kept its prices low at just \$20 a year, but even then, it's hard to recommend this password manager today, given its lack of development. Lastpass and 1Password all offer a lot more just for a small price jump. True Key: Costs and what is covered by True Key offers both free and premium levels. Some McAfee subscription packages also include True Key as a built-in password manager. The free tier for True Key is just a teaser, with only 15 passwords on one device. It's not enough to reach someone. Premium-level True Key is very inexpensive for just \$19.99 per year. This allows you to create and manage up to 10,000 passwords, sync all devices and securely store information in your digital wallet. All your data is encrypted on your device before it syncs with True Key servers. True Key supports Windows 7 and above, and macOS 10.12 Sierra and above. Supported browsers include Google Chrome, Mozilla Firefox and the older version of Microsoft Edge. Safari is only supported on iOS, while the new Chrome-based Edge version uses the Chrome extension. True Key desktop apps for Mac and Windows seem to have been discontinued. On mobile devices, True Key is available for iOS 9.0 and above, as well as android 4.1 and above. For this review, I used True Key on the 2017 MacBook Pro 15 running Windows 10 and macOS 10.14 Mojave, iPhone 7 Plus, and Google Pixel 3. Google Chrome has been my main browser on all platforms, but testing on iOS has also been done with Safari.SetupSetup for True Key is relatively simple as there is only a web app and desktop extension, but there are a few oddities along the way. You just need to get a download link on the True Key website, and it will redirect you to download Chrome, Edge or Firefox extension, and from which will redirect you to the True Key web app. (Image credit: Tom's Guide) Now you need to create an account by entering email and the main password. Unlike most password managers, True Key allows you to reset your main password if you have one of your trusted devices. This option is on by default, but can be turned off. You start with a free account that allows you to store only 15 passwords, so you have to purchase a version of Premium. This process is quick and easy and will return you to the web app when you are done. One strange thing to note: When I installed True Key on Chrome, it signed me out of every account in the browsers that I had opened. I haven't seen this with any other password manager. True Key has a strong affinity for multifactor authentication (MFA). During setting, it allows you to add a total of four factors: the main password, a second device such as a smartphone or tablet, a trusted device (such as the computer you use to create an account) and a trusted email address. Confirmation of a trusted email address took about a full day to show for some reason; all other factors were automatically approved. (Image credit: Tom's Guide) If you've already used another password manager, either offline or built into your browser, you should import existing data into True Key. This is a weak spot for True Key, since it only supports imports from LastPass, other True Key accounts or from the Chrome password manager. I made several attempts to get True Key to import a comma split value (CSV) file exported from Dashlane, but couldn't get it to recognize two entrances. Ultimately, I imported the list directly from Chrome. Although it required downloading additional software from True Key, it imported my logins perfectly. True Key has mobile apps for Android and iOS, although the customization process doesn't really bring them to your attention. You need to go to the appropriate app stores to download them, and from there it's just a matter of logging in with your True Key credentials. Your data will be automatically synchronized. True Key on the desktop is no longer a desktop app for True Key, and browser extensions simply redirect you to the True Key web interface. This is the only way to access True Key on your desktop. The web app is beautifully laid out and easy to use, in no small part, because there is so little True Key. There are only three components: Logins, Secure Notes and Wallet. The last two categories are not included in your free limit of 15 login credentials. (Image credit: Tom's Guide) Default logins are displayed in a grid with logos for the most popular sites. Clicking the logo will take you directly to the site and automatically log in. Hovering on the record site will show options to your favorite, edit, or delete the record or copy the password. The built-in True Key password generator is attached to the Add a New Login button on the Login screen, but it's not tagged, so I didn't recognize it immediately. (Image credit: Tom's Guide) Password Generator allows you to use lower-number letters, upper-body letters, numbers and special symbols, but generated passwords over 30 characters. By default, the number of characters is 16, which is enough for most applications. However, some other password managers, such as 1Password, have generators that can create passwords of 100 characters or more. Safe Notes allows you to create color notes that contain any information you can save. You can sort them alphabetically by the first letter in the title of the note or by the date of each note's creation. (Image credit: Tom's Guide) You can search for the contents of the notes, and color coding is useful, but this feature just feels tacked on compared to the awesome organizational options available on 1Password.The wallet is better thought out, with managed records for addresses, credit cards, driver's licenses, memberships, passports and Social Security numbers or other forms of national identification. (Image credit: Tom's Guide) Unfortunately, this is only the place to store this information, since True Key does not offer any feature of filling out the form and will not automatically fill out your credit card number when it collides with the cash page of the shopping site. In general use, the app worked perfectly on its main task offering in my username and password when it comes to life. It pulls up the list to drop out if you have multiple potential login to one site. (Image credit: Tom's Guide) If you create an account on the website, you can access the a version of the password generator that has the same functionality as the full version in the web application. When you're done creating a new account, True Key puts a banner at the top of the page, giving you the ability to save credentials, not save them now or never save credentials for that site. Overall, the user interface and user experience of the True Key web application are pretty good, but there aren't just enough features to justify even the low price of the service. True Key was once a leader with biometric support and innovative multifactor authentication, but the rest of the market continued to move forward while True Key stagnated. True Key Mobile AppsIn the present limited feature set of desktop experience, it's no surprise that mobile apps manage to duplicate it to the fullest. Left: iPhone; Right: Android (Image: Tom's Guide) Launchpad displays all your mesh passwords, just like a desktop app, and with two taps you can instantly log into the listed sites. Unfortunately, you can't just set the default browser for this action, so it's not a one-tap experience. Android (Image: Tom's Guide) True Key mobile apps have an unimpressive built-in browser that was much more important before Android and iOS were able to automatically fill in for any browser. Now you'll be better off just sticking to your favorite mobile browser. Left: iPhone; Right: Android (Image: Tom's Guide) Mobile versions of Secure Notes and Wallet also function identically to their desktop counterparts, except that the entries appear in one column rather than in the grid. You can create, edit, or delete these posts on mobile apps. Both: iPhone (Image: Tom's Guide) Finally, the password generator is identical to the version found in the desktop app. Left: Android; Right: iPhone (Image: Tom's Guide) If you choose advanced security on the mobile app, you can claim both the main password and fingerprint, or the main password and person identification to unlock the True Key app. True Key. SecurityLike other password managers, True Key relies on constant encryption AES-256 to keep your passwords safe on your device. Your information is only ever unencrypted on your device, so nothing readable hits True Key servers. (Image credit: Tom's Guide) As I mentioned in the Settings section above, True Key has a strong focus on multi-factor authentication for your core password. It will encourage you to add two trusted devices, a trusted email address, a fingerprint on iOS or Android and anything that is supported by Windows Hello on a supported PC (only on the edge). It is worth noting that while these second Certainly to help your security, True Key does not support any of the forms of strong two-factor authentication (2FA) options that have become common in the last few years, such as app authenticator like Google Authenticator or Authy, or 2FA hardware like YubiKey or Titan Key Security. Lo! Lo! It supports 2FA text message codes on your phone via SMS, but again a few password managers do. Aside from low prices, there is little to be recommended about True Key today. He just fell behind front-runners like Keeper and LastPass. If you get True Key as part of a McAfee subscription package, I'd stay away from it. Even the free level on LastPass has more features and features than True Key. The key.
